

ABSTRACT OF THE DISCLOSURE

A storage case that stores a disk, such as a compact disk, in a medium storage section of the body thereof includes a storage state determining section that allows the presence or absence of the disk to be identified by the sense of touch from the outside. The storage state determining section is formed by providing the storage case with a movable section such that a projection piece rises or sets through a window section provided on a side surface of the storage case body in accordance with the presence or absence of the disk within the storage case body.
